Applications

The VG1000 Series Ball Valves are designed to regulate the flow of hot or chilled water (and for some models, low pressure steam) in response to the demand of a controller in Heating, Ventilating, and Air Conditioning (HVAC) systems.

**IMPORTANT:** Use the VG1000 Series Valves as an operating control. Where failure or malfunction of the VG1000 Series Valve could lead to personal injury or property damage to the controlled equipment or other property, additional precautions must be designed into the system. Incorporate and maintain other devices, such as supervisory or alarm systems or safety or limit controls, intended to warn of or protect against failure or malfunction of the VG1000 Series Valve.

Installation

Install VG1000 Series Ball Valves with the actuator at or above the centerline of the horizontal piping, as shown in Figure 1.

**IMPORTANT:** In steam applications, install the valve with the stem horizontal to the piping. Failure to follow these guidelines may shorten the life of the actuator.

To minimize heat transfer in steam applications, wrap the valve and piping with insulation. Allow sufficient clearance to remove the actuator (as illustrated in the dimension drawings, Figure 6 through Figure 15). When mounting the actuator in the field (before installation), use an adjustable wrench to manually rotate the valve stem several times. This rotation breaks the torque that may have built up during long-term storage. For the valve to move in the proper direction, wire the input lines to the electric actuator correctly.

Figure 1: Mounting Positions for Chilled Water and Condensing Atmosphere Applications
IMPORTANT: Take care to prevent foreign material such as weld slag, thread burrs, metal chips, and scale from entering the piping system. This debris can damage or severely impede the operation of the valve by embedding itself in the seats, scoring the valve, and ultimately resulting in seat leakage. If the debris becomes embedded in the seats, subsequent flushing and filtering of the piping system with the valve installed does not remedy the problem.

For more detailed installation information about the specific equipment used, refer to the appropriate document from the following list:

Note: To avoid excessive wear or drive time on the motor for VA9104, M9104, M9106, and M9109 AGx models, use a controller and/or software that provides a time-out function to remove the signal at the end of rotation (stall). The IGx and GGx models have an auto shutoff to avoid excessive wear or drive time on the motor.

On models with the flow-characterizing disk, the disk is located in Port A. Port A must be the inlet. On three-way models, use Port A as the coil inlet and Port B as the bypass inlet.
VG1841 and VG1845 Series Three-Way Ball Valves have a different port configuration from VG1644 Series Three-Way valves. See Figure 2, Figure 3, and Figure 4 for details.

Contact your local Johnson Controls® representative for compatibility concerns before using VG1000 Series Ball Valves to control the flow of fluids other than those outlined in the Technical Specifications table in this document.

**Press Valve Installation**

VG1000 press end connection valves are installed using RIDGID® press tools. Always refer to the operator’s manual supplied with the RIDGID press tool that is used to make the valve end connections. The manual should provide proper instructions for the safe operation of the tool, proper crimping procedures, and methods of inspecting the finished connection. If you use a battery-operated press tool, ensure its proper operation by fully charging the unit. To avoid damage to the integral O-ring, never use sealant or pipe dope with a press connection. Always inspect the end connections of the valve before making the connection. The end connection should not be deformed, and the internal, integral O-ring must be in place for a proper seal.

**Sweat Valve Installation**

When soft soldering sweat ball valves, be sure to use a low temperature solder with a melting point that does not exceed 450°F (232°C). For lead-free RoHS compliance, a 96.5% tin/3.5% silver solder is recommended. Never install the actuator on the valve until you have completed the soldering operation and the valve body has cooled. Before soldering, minimize the risk of damage to the ball seals by positioning the ball so that Port A is fully open. When soldering, always apply a wet rag around the valve’s neck and cover as much of the valve body with the rag as possible. Direct the tip of the flame away from the valve and always heat the copper tubing directly, but never the valve body. Solder Port A first, then the remaining ports. These steps provide maximum protection to the internal valve components. See Figure 5 for details.

**IMPORTANT:** Protect the actuator from dripping water, condensation, and other moisture. Water or moisture could result in an electrical short, which may damage or affect the operation of the actuator.

**IMPORTANT:** Do not cover the actuator with thermal insulating material. High ambient temperatures may damage the actuator, and a hot water pipe, steam pipe, or other heat source may overheat it.

Piping

Note: Mount the valve downstream from the coil to minimize heat transfer to the actuator.

Figure 15: Typical VG1000 Piping
Wiring

Be sure to wire the input lines to the electric actuator correctly for the valve to move in the proper direction.

**IMPORTANT:** Use copper conductors only. Make all wiring connections in accordance with local, national, and regional regulations. Do not exceed the actuator’s electrical ratings.

**WARNING:** Risk of Electric Shock. Disconnect the power supply before making electrical connections. Contact with components carrying hazardous voltage can cause electric shock and may result in severe personal injury or death.

**CAUTION:** Risk of Property Damage. Do not apply power to the system before checking all wiring connections. Short circuited or improperly connected wires may result in permanent damage to the equipment.

Troubleshooting

**Servicing the Actuator or Piping System**

When servicing the electric actuator or the piping system:

- disconnect the power supply to the actuator.
- relieve the pressure in the piping system.

**IMPORTANT:** Do not attempt to manually rotate the drive shaft while the actuator is installed without first releasing the actuator gears. Manually rotating the drive shaft without releasing the actuator gears may result in permanent damage to the actuator.

Repair Information

If the VG1000 Series Forged Brass Ball Valve fails to operate within its specifications, replace the unit. For a replacement valve, contact the nearest Johnson Controls® representative.

**Rangeability**
- Greater than 500:1

**Minimum Ambient Operating Temperature**
- **-4°F (-20°C)**: VA9104 and M9104 Series Non-Spring Return Actuator
- **-4°F (-20°C)**: M9106 and M9109 Series Non-Spring Return Actuators
- **-22°F (-30°C)**: VA9203 Series Spring Return Actuators
- **-40°F (-40°C)**: VA9208 Series Spring Return Actuators

**Maximum Ambient Operating Temperature (Limited by the Actuator)**
- Direct Mount or with **M9000-561 Thermal Barrier**
  - **140°F (60°C)** VA9104 Series Non-Spring Return Actuators
- **M9000-551 Linkage**
  - **140°F (60°C)** M9104 Series Non-Spring Return Actuators
- **Direct Mount or with M9000-561 Thermal Barrier**
  - **140°F (60°C)** VA9203 and VA9208 Series Non-Spring Return Actuators
- **M9000-5xx Series Linkage**
  - **125°F (52°C)** M9106 Series Non-Spring Return Actuators
  - **122°F (50°C)** M9100 Series Non-Spring Return Actuators

**Leakage**
- 0.01% of Maximum Flow per ANSI/FCI 70-2, Class 4
- 1% of Maximum Flow for Three-Way Bypass Port

**End Connections**
- National Pipe Thread (NPT): 1/2 to 2 in. (DN15 to DN50)
- Sweat: 1/2 to 1 in. (DN15 to DN25)
- Press (ProPress® Compatible): 1/2 to 1 in. (DN15 to DN25)

**Materials**
- **Body**: Forged Brass
- **Ball**: VG12x1 and VG18x1 Series: Chrome Plated Brass
  - VG12x5 and VG18x5 Series: 300 Series Stainless Steel
- **Blowout-Proof Stem**: VG12x1 and VG18x1 Series: Nickel Plated Brass
  - VG12x5 and VG18x5 Series: 300 Series Stainless Steel
- **Seats**: Graphite-Reinforced Polytetrafluoroethylene (PTFE) with Ethylene Propylene Diene Monomer (EPDM) O-Ring Backing
- **Stem Seals**: EPDM Double O-Rings
- **Characterizing Disk**: Amodel® AS-1145HS Polyphthalamide Resin

---

1. Proper water treatment is recommended; refer to the VDI 2035 Standard.
2. Rangeability is defined as the ratio of maximum controllable flow to minimum controllable flow.
3. In steam applications, install the valve with the stem horizontal to the piping and wrap the valve and piping with insulation.

The performance specifications are nominal and conform to acceptable industry standards. For application at conditions beyond these specifications, consult the local Johnson Controls office. Johnson Controls, Inc. shall not be liable for damages resulting from misapplication or misuse of its products.
