Remarks

Manual Zero-Point Calibration	In normal operation zero-point calibration should be executed every 12 months. Attention! For executing zero point calibration the power supply must be connected one hour before. <ul style="list-style-type: none"> • Release both connection tubes from the pressure terminals + and - • Press the button S1 until the LED lights permanently • Wait until the LED flashes again and reinstall the connection tubes to the pressure ports (note + and -)

Detailed documentation

The separate document Sensor Modbus-Register informs about Modbus register, addressing, parity and bus termination (DIP1: address, DIP2: baud rate, parity, bus termination)

In addition to the information on the bus, the following analog outputs are available:
 AOU1: differential pressure
 AOU2: volumetric flow

The volumetric flow is calculated from the differential pressure, the k-factor and the height
 Factory setting for the k-factor is 1.00 and for the height 330 metres above sea level.
 The values of the k-factor and the height can be changed via Modbus or BACnet.

Notes Wiring RS485

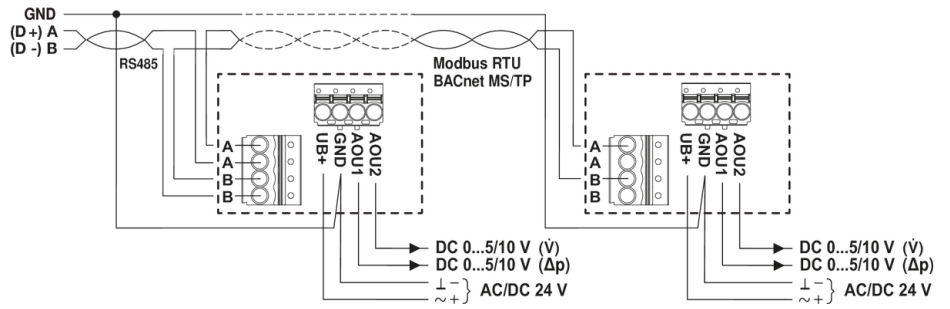

Connection via safety isolating transformer.

Parallel connection of other actuators possible. Observe the performance data.

The wiring of the line for Modbus (RTU) / BACnet (MS/TP) is to be carried out in accordance with applicable RS485 regulations.

Modbus / BACnet: Supply and communication are not galvanically isolated. Connect earth signal of the devices with one another.
